ABSTRACT

Currently, delays in dealing with power outage by Nationl Electricity Company (PT PLN) largely due to ineffectiveness of information distribution system in the departement who receive complaints from customer and deliver it to the repair team in the fields. Therefore we need such a application for distribution of power outage information based on Android that capable of facilitating power outage service system in receiving problem report and deliver process of power outage evaluation which is ongoing or is done. Google Map Usage provides lots of assistance in mapping the nearest repair team location to where area of the power outage happened. The application is designed preceded by conducting analysis method of user requirement including analysis of the ongoing system, analysis of the findings of interview result as well as indentification of information necessity and system requirements. Designing focused on the Interface User Screen Design of mobile device and Web Admin Design. The research has resulted in a system modelling that capable of supporting the smooth running of distribution process of information on power outage in National Electricity Company.

Keywords: Distribution of Electricity Problem Information, Android.

1. INTRODUCTION

Now a days the technological advancement develops very rapidly. One of technologies which has continuous development until now is information technology in mobile device. In the past mobile device only able to be used for the oral communication between human. But recently the capability of mobile device is highly sophisticated, where the work which previously only can be done by computer now can be carried out by mobile device.

One of operating systems which used by mobile device is Android. Android is a linux-based operating system for mobile device. The superiority of Android over other mobile device operating system is that Android has the characteristic of open source code so people can customize the features which has not existed in the Android operating system in accordance with their demands and desire. This capability of Android attract National Electricity Company's (PT. PLN) attention and make they is interested to use Android-based application for dealing with information on power outage which has been managed on manual so far they still use Handy Talky (HT).

National Electricity Company (PT PLN) is a company that provide the biggest electricity supply service in Indonesia. As one of Stated Owned Enterprise (BUMN) in Indonesia, PT. PLN is required to run the bussiness as well as possible in order to make people's prosperity and do not charge to the state budget for the financial loss that made on the business.

To improve the work system that still use ineffective management particularly in dealing with complaints from customer about the power outage and the issue of job evaluation by management, , PT. PLN (Persero) need Android-based application that capable of dealing with difficulties in distributing information on power outage. This application is expected to be able to facilitate

complaints report management by call center officer and working team and facilitate process of problem evaluation that has been done or is ongoing. The expectation is that the Andorid-based application can improve quality of customer service to become better and efficient. This system is indirectly aimed at improving customer satisfaction.

Moreover, National Electricity Company (PT. PLN (Persero) face the problem of distributing information on the power outage can be elucidated as follow:

- 1. Frequently problem with communication device such as signal failure and HT's battery that is quickly run down when the admin need to send information on the area where the power outerage happened to the repair team in the fields.
- 2. The repairs team had difficulties in searching location where the power outrage happened so that they need method to find the location quickly and accurately.

The objective of this paper that is expected to be reached and the desired advantages to be developed shall be as follow:

> Design and makeAndrois-based application for distributing information on power outrage that able to facilitate providing service system of power outrage in receiving report on power outrage and send evaluation process of power outrage that is ongoing or have been done.

The advantages of this paper shall be as follow :

- a. Assist people to get immediate and quick service on dealing with power outage that managed by PT. PLN (PERSERO) in the distribution area of Jakarta Raya and Tangerang.
- b. Facilitate immediate and quick service probided by PT. PLN (PERSERO) in the distribution area of Jakarta and Tangerang to deal with power outage.

2. RELATED WORKS

Han Qi, 2012 [4] introduced Mobile Cloud Computing (MCC) which combines mobile computing and cloud computing, has become one of the industry buzz words and a major discussion thread in the IT world since 2009. As MCC is still at the early stage of development, it is necessary to grasp a thorough understanding of the technology in order to point out the direction of future research

Ramanamurthy, 2012 [9] introduced methods and systems for indoor navigation utilize a smartphone equipped with various sensors. When a person whose initial position is unknown, and in some circumstances whose sight has been impaired, specifies a destination, the navigation system will calculate the coordinates of his/her present location from the sensor readings. It will then calculate the distance to be traveled to the destination and form routes to direct him/her towards the desired location. These steps are carried out using sensor readings and in some cases magnetic maps of the interiors of buildings stored on the smartphone. In some cases dynamic time warping ("DTW") is used to align a recorded signature of the person's movement through the building with a stored magnetic map in order to identify the person's location within the building.

Sighal, 2012 [11] introduced the help of A-GPS in phones and through Web Services using GPRS, Location based Services can be implemented on Android based smart phones to provide these valueadded services: advising clients of current traffic conditions, providing routing information, helping them find nearby hotels.

3. METODOLOGY

• The Preceding research

The peceding research carried out by interviewing National Electricity Company (PT. PLN (Persero) management to find out what function needed in this application and interviewing National Electricity Company's employee who will have an advantage of this Android-based application in distributing power outage information

- Reference Many related information are collected from reference books and websites that provide literature on topic that studied in this research.
- Requirements Analysis We need to carry out requirement analysis to find out what kind of application that meet user demand.
- The Following Design Method are used in this research [8]:

20th March 2015. Vol.73 No.2 © 2005 - 2015 JATIT & LLS. All rights reserved

- Use Case Diagram
- Class Diagram Design
- Sequence Diagram Design
- Database Design
- Screen Display Design
- Writing Program Code
 - Write the program code of the application that need to be made. In this activity, program code is made by adjust programming language to the application that can be used to create application in accordance with illustration on design.
- Program Test and Improvement
 - Having been written the program tested by running it and review the program evaluation. If the program has comply with the objection and the required functions it will ready to be applied. Conversely, the faulty program will be improved.
- Final Report Having been tested and the desired result achieved, all procedure compiled and completed in written report.

3. DESIGN & IMPLEMENTATION

Figure 1 Web Admin System configuration

The following is configuration guidance on hosting server that has to do in order to make the web application running well. The configuration process shall be as follow :

• Make database in hosting server

- Import the file sql containing table for the required database
- Upload file html and php to hosting server

Figure 2 Android System Configuration

To make the application can be applied, the android mobile device need the starting installation. The following is installation

stages:

- *Copy* this application installation software package in the form of .apk into *my file* folder on the Android *mobile device*
- Open the .apk file then the application will be automatimatically installed
- Having the Android mobile devide been installed, page of the application interface showed. The *interface* page is the first page that showed after the user open the mobile application.

4. EXPERIMENTS AND RESULT

Display page of Show the location of Power outage

The Power Outage Page show detailed information concerning data of consumen who has problem of power outage. The data contains name, address, phone number, and information addition. On the bottom part there are 2 keys namely Power Outage Location and Renew Status.

Display Page of Update Status

Figure 7. Display Page of Update Status of The Power Outage

On the page of Update The Power Outage there are options of the Power Outage Status that can be choosed by the repairs Team. There are also explanation box to clarify status of the power outage. On the bottom side there is the Sending Message button to deliver information the power outage status to the admin post.

How To Use Web Application

The Admin post has task to send information concerning the power outage to the Repairs Team in the fields by using the modified web application with addition function to determine the power outage location accurately to send information of the power outage (both power outage location and the power outage problem) to the Repairs Team. The first process that has to be done by admin before using the web application is login in accordance with the username and the made password. On this page, only the user who has the access right to login.

The Home Page

The Home Page on this web application contains data of the power outage that come and processes by PT PLN. The following is display of home page indicating feature to open Google Maps.

Sending message can be done by pressing icon '+' to add data, then choose menu 'Push Message'. This menu will send every line of message excluding message regarding the SENT and RECEIVED status.

5. CONCLUSION

After completing the design and development of the system, as well as through the implementation and evaluation

- This application facilitate admin sending data of the power outage location by Google Maps aid to the the repairs team on the fields so that the point of the power outage location will be found quickly and accurately.
- This application also facilitate the repairs team getting direction of the power outage location quickly and accurately.
